CliniClaw Demo Day Guide

⚠️ **Attention Demo PICs!**
On the demo day, you will have access to a DGX Spark with the demo already pre-configured. You must, however, run these two commands before starting the demo:

```
nemoclaw hermes-health
bash /home/nvidia/ehrclaw-demo/scripts/run_vllm.sh
```

The second script will take around 5-7 minutes (you can monitor it with `docker logs <id> --follow`)
Once done, open the demo on http://localhost:8090/

Demo Walkthrough Examples

Example 1: Carmen

The story is: **"A patient asks about a painkiller. CliniClaw checks the chart, investigates medication safety, spots missing information, and helps organize the next steps."**

Step	Exact prompt or click	What to highlight
1	Click **Triage Queue**	Reviews everyone's intake (nurse transcript); patients move into their new positions.
2	Open **Carmen** → **Generate summary**	Turns a long intake and chart into a concise handoff.
3	`Any conditions the patient has? Which medicines are listed in their chart?`	Distinguishes charted prescriptions from

Step	Exact prompt or click	What to highlight
		medicines the patient actually takes.
4	`Check ibuprofen interactions with those medicines.`	Uses the drug-label skill and retrieved sources to investigate the patient's question.
5	`When were Carmen's last kidney tests?`	Retrieves dated results. A relevant testing gap should prompt an optional lab-request offer.
6	`Let's book them for a kidney function test`	Creates an editable request. Review it, then click **Confirm blood-test request**.
7	`Arrange follow-up. Bring all medicines. No new medicines today.`	Records your plan and should offer three appointment times directly in chat.
8	`Book the second one.`	Converts a conversational choice into a confirmed local appointment.
9	`Generate an after-visit summary.`	Builds the patient handout from your conversation and confirmed actions.
10	Click **Open summary**	Show the plain-language plan, appointment details, and blood-test request.
11	Click **Close case**	Patient leaves the office; their seat stays empty.

Example 2: Florence

The story: **“An ankle injury is getting worse. CliniClaw catches important details, checks the chart, and helps turn the clinician’s plan into an imaging request and follow-up.”**

The imaging and follow-up decisions below are scripted clinician input for the demo.

Step	Exact prompt or click	What to highlight
1	Click **Triage Queue**	Agent analyzes the intake transcripts and prioritizes patients.
2	Open **Florence** → **Generate summary**	Summarizes the injury, worsening symptoms, and difficulty walking.
3	`Any relevant ankle history in her chart?`	Searches the EHR and distinguishes historical records from this new injury.
4	`Show her medicines and allergies.`	Retrieves chart evidence and identifies missing information.
5	`Is it safe to combine Aleve and ibuprofen?`	Demonstrates drug-label retrieval from OpenFDA API.
6	`The patient should stop Aleve and we will not prescribe ibuprofen. let's prescribe them paracetamol.`	Demonstrates prescription
6	`Let's book the patient for right anke X-ray`	Creates an editable imaging request. Review and **confirm the card**.
7	`Let's book them for a follow up to review the X-ray before deciding treatment`	Captures your plan and should offer three appointment times.
8	`Book the second one.`	Confirms the selected appointment directly from chat.
9	`Generate an after-visit summary.`	Combines your documented plan, confirmed imaging request, and appointment details.
10	Click **Open summary**	Show the patient-friendly handout and its next steps.

Step	Exact prompt or click	What to highlight
11	Click **Close case**	Florence leaves the office; her seat stays empty

Example 3: Dara

Dara's story: she feels tired and lightheaded after a heavier period, missed her blood tests, and wants help preventing another difficult period. CliniClaw connects her history to the chart, catches a medication conflict, and helps carry out the clinician's plan.

Step	Exact prompt or click	What to highlight
1. Triage	Click **Triage Queue**	Start with the whole waiting room.
2. Understand Dara	Select **Dara** → **Generate Summary**	Turns the intake into a concise, chart-supported handoff.
3. Review medicines	`Show her medicines and allergies.`	Retrieves information the clinician needs before considering treatment; listed medicines still need reconciliation.
4. Investigate the gap	`When was her last blood count?`	An old result doesn't explain today's symptoms. The agent suggests a relevant next step.
5. Introduce the candidate	**Say aloud:** "She also wants help with heavy periods. Before considering a medicine, let's check it against her chart."	
6. Check safety	`Is tranexamic acid safe to take with her current medications?`	**The key reveal:** a proposed medicine conflicts with an existing chart medication.
7. Record the clinician's plan	`Okay then we will not prescribe tranexamic acid today. Let's request a lab result for complete blood count for her fatigue.`	Moves from evidence to a concrete action under clinician direction.
8. Confirm the request	Review the card → **Confirm blood-test request**	Visible completion; this creates a request for blood test.

Step	Exact prompt or click	What to highlight
9. Arrange follow-up	`Arrange a follow-up to discuss the results and start a treatment plan.`	No separate scheduling tab.
10. Book	`Book the second one.`	Conversational action with a visible outcome.
11. Give Dara her summary	`Generate her after-visit summary.`	The clinician doesn't have to rewrite the conversation.
12. Finish	Click **Close case**	A clear end to the journey.

About Tab

- Explain Architecture
- Model is running locally on the DGX Spark (Qwen-3.6 35B model)
- We're using NVIDIA's open source *NV-CXR-Reason* skill for the X-ray image analysis component
- NeMo Relay is used for observability
- NVIDIA's OpenShell used for security

Activity Tab

Highlight:

- This is where we can see the `soul.md` file, which is the agent component that defines the character and vibe
- This is where the agent **memory** can be monitored
    - *if empty, go to the chat and send "Remember this: My name is Dr. House". The new memory should then show.*
- This is also where you can keep track of the custom **skills** we added, and see the progression of the skills, as Hermes agents have self-improving capabilities.

Traces Tab

All agent actions, including tall calls, reasoning, can be fully traced, to understand what the agent did. Powered by NeMo Relay.
